Graphics Systems in R

There are many graphics systems in R for making plots and figures.

We have already played a little with “**base R**” graphics and the ‘plot()’ function.

Today we will start learning about a popular graphics package called ‘ggplot2()’.

This is an add on package - i.e. we need to install it. I install it (like I install any package) with the ‘install.packages()’ function.

```
plot(cars)
```

Before I can use the functions from a package I have to load up the package from my “library”. We use the ‘library(ggplot2)’ command to load it up

```
library(ggplot2)
ggplot(cars)
```

Every ggplot is made up of at least 3 things: - data (the number etc. that will go into your plot) - aes (how the columns of data map to the plot aesthetics) - geoms (how the plot actually looks, points, bars, lines, etc.)

```
ggplot(cars) +
  aes(x=speed, y=dist) +
  geom_point()
```

For simple plots ggplot is more verbose - it takes more code - than base R plot.

Add some more layers to you ggplot:

```
ggplot(cars) +  
  aes(x=speed, y=dist) +  
  geom_point() +  
  geom_line() +  
  geom_smooth(method="lm" , color="pink") +  
  labs(title="Stopping Distance of Old Cars", subtitle = "A Silly Example Plot")
```

`geom_smooth()` using formula = 'y ~ x'

Gene Expression Changes Upon Drug Treatment

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

	Gene	Condition1	Condition2	State
1	A4GNT	-3.6808610	-3.4401355	unchanging
2	AAAS	4.5479580	4.3864126	unchanging
3	AASDH	3.7190695	3.4787276	unchanging
4	AATF	5.0784720	5.0151916	unchanging
5	AATK	0.4711421	0.5598642	unchanging
6	AB015752.4	-3.6808610	-3.5921390	unchanging

```
ggplot(genes)+
  aes(x=Condition1, y=Condition2, col=State)+
  geom_point()
```

```
p <- ggplot(genes)+  
  aes(x=Condition1, y=Condition2, col=State)+  
  geom_point()  
  
p + scale_color_manual (values=c("blue", "gray", "red"))
```

```
p + scale_color_manual (values=c("blue", "gray", "red"))+
  labs(title="Gene Expression Changes Upon Drug Treatment",
        x="Control (No Drug)",
        y="Drug Treatment")
```

Gene Expression Changes Upon Drug Treatment

Gapminder

gapminder_2007

```
library(gapminder)
library(dplyr)
```

Attaching package: 'dplyr'

The following objects are masked from 'package:stats':

filter, lag

The following objects are masked from 'package:base':

intersect, setdiff, setequal, union

```
gapminder_2007 <- gapminder %>% filter(year==2007)
```

plotting

```
ggplot(gapminder_2007)+  
  aes(x=gdpPercap, y=lifeExp)+  
  geom_point()
```

add “alpha=” to ‘geom_point()’ to make points more transparent

```
ggplot(gapminder_2007)+  
  aes(x=gdpPercap, y=lifeExp)+  
  geom_point(alpha=0.5)
```

Adding Colors with 'aes()' function

```
ggplot(gapminder_2007)+  
  aes(x=gdpPerCap, y=lifeExp, color=continent, size=pop)+  
  geom_point(alpha=0.5)
```

Scaling Information

```
ggplot(gapminder_2007)+
  aes(x=gdpPerCap, y=lifeExp, color=continent, size=pop)+
  geom_point(alpha=0.5)+
  scale_size_area(max_size=10)
```

gapminder_1957

```
gapminder_1957 <- gapminder %>% filter(year==1957)
```

plotting

```
ggplot(gapminder_1957)+
  aes(x=gdpPercap, y=lifeExp, color=continent, size=pop)+
  geom_point(alpha=0.7)+
  scale_size_area(max_size=15)
```

Plotting both 2007 and 1957

```
gapminder_1957 <- gapminder %>% filter(year==1957 | year==2007)

ggplot(gapminder_1957)+
  aes(x=gdpPercap, y=lifeExp, color=continent, size=pop)+
  geom_point(alpha=0.7)+
  scale_size_area(max_size=10)+
  facet_wrap(~year)
```
